Hi Eric:  
Following up on our discussion earlier today-

1. Jay used the Query Manager "Portland Harbor Cat1 All" database to model the LRM/FPM values for this analysis.
2. The bioassay's used in this analysis are limited to the Rd2A (233 stations) for all 4 receptors/endpoints which is consistent with the analysis done by the LWG in the Round 2 Comp. Report
3. The Cat1 All database in Query Manager (and the Cat1 Risk database) contains more toxicity data that could be considered- for example the Hyalella 10d survival shown below.

Thanks-  
Ben
